

Customer Intake Record — Woodgrove Ticketing

OIDC SSO (PKCE) | No SCIM Provisioning | Port 5012

General Information

Field	Value
Customer Name	Woodgrove Ticketing
Application Name	Woodgrove Ticketing
Date of Request	2026-04-27
Requested By	IAM Onboarding Team
Priority	Standard

SSO Configuration

Field	Value
SSO Protocol	OIDC (OpenID Connect)
Redirect URI	http://localhost:5012/auth/callback
Supported Account Type	Single tenant
Client Authentication	PKCE (public client, no secret)
API Permissions	Microsoft Graph > Delegated > User.Read

OIDC via App Registration (not Enterprise App). Auth code flow with PKCE. Tokens instead of assertions.

Required Claims / Attributes

Source	ID Token Claim
Standard OIDC claims	sub, name, preferred_username, email

App also calls Microsoft Graph /me for displayName, givenName, surname, jobTitle, department.

Group Claims

Field	Value
Group Claim Required	No

SCIM Provisioning

Field	Value
SCIM Provisioning Required	No
Reason	JIT provisioning on first OIDC login

Deprovisioning Behavior

Field	Value
When user is unassigned	Access revoked (no new tokens issued)
When user is deleted	Cannot authenticate; app account orphaned

Governance gap: Without SCIM, deprovisioning is not automated. Orphaned accounts remain until manually cleaned up. This gap is critical interview material.

Notes

Flask OIDC RP on port 5012. Full auth code + PKCE flow with token exchange.

Configured via Entra App Registration, not Enterprise App.

No client secret stored. PKCE replaces the secret for this public client.

Key comparison: SAML = metadata + assertions. OIDC = client ID + tokens. No SCIM = governance gap.
